Reviews

This ebook is worth acquiring. Better then never, though i am quite late in start reading this one. You will not truly feel monotony at at any time of your own time (that's what catalogues are for about if you ask me).

Arcler Education Inc, Canada, 2016. Hardback. Condition: New. Language: English. Brand new Book. A Database Management system (DBMS) is a software system that provides basic functions for processing of large amounts of data: simple search, storage with minimum redundancy, data updates, and concurrent (competitive) usage of the same set of data, data reliability, and data security. The DBMS also enables a logical and physical independence between the application program and the data, data integrity (accuracy) and easy communication with the database via user-friendly SQL language. Before the DBMS can be used, the database is first designed by collecting the data and identifying entities, their attributes and the relationships between entities. There is semantic and logical data modeling in the process of database design. The well-known database design models are ER (Entity Relationship) model and the UML (Unified Modeling Language). There are structural and semantic data integrity constraints imposed by the DBMS. The structural integrity means that any update operation has to bring the database in a consistent state. Semantic integrity refers to maintaining data accuracy and to enabling a functional meaning to the database features. Every DBMS should also enable transaction and query management, by using tools for data storage and retrieval, data processing (sorting, selection, joining) and new data generation tools that can be applied to the existing databases. Database security refers to the protection of databases from unauthorized use, modification, intentional damage or data destruction. Modern DBMSs ensure the security of data by using access control mechanisms, user authentication methods and data encryption algorithms. NoSQL databases provide mechanisms for storage and retrieval of data that is modeled in means other than the tabular relations used in relational databases (such as unstructured or semi-structured data, and data gathered from social media sites). These databases exist almost 50 years, but they...
